THE FM140A

REPRESENTS THE LATEST TECHNOLOGY

IN MIG COMBINATION UNITS. THE FM140A OPERATES

ON 115VOLT AC SINGLE PHASE CURRENT, AND FEATURES

"SMOOTH ARC" TRANSFORMER DESIGN CONCEPT.

FOR TECHNICAL SERVICE, CALL TOLL-FREE 1-800-232-9353

PROVIDE MODEL & SERIAL NUMBER
MANUFACTURER’S LIMITED WARRANTY

This equipment is warranted against defects in materials and workmanship for a period of two years from the date of purchase.

EXCEPTION: THE MIG TORCH IS WARRANTED FOR A PERIOD OF 30 DAYS FROM THE DATE OF PURCHASE.

Should the equipment become defective for such reason, the Manufacturer will repair it without charge, if it is returned to the Manufacturer’s factory, freight prepaid. This warranty does not cover: (1) failure due to normal wear and tear; (2) consumable parts, such as, but not limited to, torch contact tips, gas cups and insulating bushings; (3) damage by accident, force majeure, improper use, neglect, unauthorized repair or alteration; (4) anyone other than the original purchaser.

THIS LIMITED WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES, EXPRESS OR IMPLIED. THE MANUFACTURER SHALL NOT BE LIABLE FOR ANY INJURY TO PERSONS, INCLUDING DEATH; OR LOSS OR DAMAGE TO ANY PROPERTY, DIRECT OR CONSEQUENTIAL, INCLUDING, BUT NOT LIMITED TO, LOSS OF USE, ARISING OUT OF THE USE, OR THE INABILITY TO USE, THE PRODUCT. THE USER ASSUMES ALL RISK AND LIABILITY WHATSOEVER IN CONNECTION WITH THE USE OF THE PRODUCT, AND BEFORE DOING SO, SHALL DETERMINE ITS SUITABILITY FOR HIS INTENDED USE, AND SHALL ASCERTAIN THE PROPER METHOD OF USING IT.

SOME STATES DO NOT ALLOW LIMITATIONS ON HOW LONG AN IMPLIED WARRANTY LASTS, OR THE EXCLUSIONS OR LIMITATIONS OF INCIDENTAL OR CONSEQUENTIAL DAMAGES. SO THE ABOVE LIMITATIONS OR EXCLUSIONS MAY NOT APPLY TO YOU. THIS WARRANTY GIVES YOU SPECIFIC LEGAL RIGHTS, AND YOU MAY HAVE OTHER RIGHTS WHICH MAY VARY FROM STATE TO STATE.

WARNING

ARC WELDING CAN BE INJURIOUS TO OPERATOR AND PERSONS IN THE WORK AREA — CONSULT INSTRUCTION MANUAL BEFORE OPERATING.

ELECTRIC SHOCK can kill.
• Do not touch electrodes or other electrically live parts.
• Insulate yourself from work and ground.
• Install and ground machine in accordance with the National Electrical Code and local code(s). Read Operating Manual before installing or operating.
• Do not operate with protective covers, panels, or guard removed.
• Disconnect input power before servicing.
• Only qualified personnel should install, use, or service this equipment.

ARC RAYS can injure your eyes and burn skin.
• Wear correct eye, ear, and body protection while welding.

FUMES AND GASES can be dangerous to your health.
• Use enough ventilation and/or exhaust at the arc.
• Keep your head out of fumes.
• Do not breathe fumes.

READ AND UNDERSTAND THE MANUFACTURER’S INSTRUCTIONS AND YOUR EMPLOYER’S SAFETY PRACTICES.

ELECTRICAL SUPPLY REQUIREMENTS FOR THE FM140A

Ensure that there is a 115 volt single phase, 20 amp electrical supply within easy reach of the unit. The input cable supplied is 20 feet long. A 50 foot cable is an optional extra. The plug which is factory installed is suitable for use up to 120 amps of output. The plug must be changed if the welder is used above 120 amps of output. Attach a suitable plug making sure the green wire is attached to ground. Refer to boxes below with the WARNING and NOTE headings for more information. All wiring should be performed by a qualified electrician.

WARNING

To conform to the National Electrical Code, the power input plug must be changed if this unit is to be operated on a 20 amp circuit or higher.

Never change fuses or circuit breakers to a higher value than the wires and outlet are designed for.

<table>
<thead>
<tr>
<th>Breaker size</th>

</tr>
</thead>
<tbody>
<tr>
<td>15 Amp</td>
<td>14 Gauge</td>
</tr>
<tr>
<td>20 Amp</td>
<td>12 Gauge</td>
</tr>
<tr>
<td>30 Amp</td>
<td>10 Gauge</td>
</tr>
</tbody>
</table>

Do not rely on the circuit breaker built into the FM140A to protect your wiring. This circuit breaker protects the FM140A internal wiring only.

Do not use undersized extension cords. Follow the cord manufacturer’s recommendations as to current carrying capacities.

Make sure all electrical wiring is installed by a qualified electrician.

NOTE

The maximum output of the FM140A will be limited by the size (amp rating) of the circuit used.

Operation on a 15 amp circuit (14 gauge wire) will limit maximum output to 100 amps.
Operation on a 20 amp circuit (12 gauge wire) will limit maximum output to 120 amps.
Operation on a 30 amp circuit (10 gauge wire) will result in maximum output of 140 amps.

FM140A output will be limited also by low input voltage (less than 120 volts), long input cords and use of extension cords.
INTRODUCTION

The Snap-On Tools FM140A is a combination welding power source, wire feed unit, MIG torch and accessory package. It operates on 115 volts AC input current and is designed to meet the requirements of auto body repair shops. The FM140A produces fusion welds by the Gas Metal Arc Welding process (GMAW or MIG), on steel up to 1/4" thick (aluminum 3/16"), using .023" through .045" steel wire and .025" through 3/64" aluminum wire with the optional MHG5-A. (Optional liners and contact tips must be purchased to cover given wire sizes). Heavier sections can be easily welded using slightly different techniques. Consumable MIG Spot Welding on steel can be performed with this unit.

The number of controls on the unit have been reduced to assist inexperienced operators learn MIG welding. This facilitates rapid set up for welding different thicknesses of material requiring various heat inputs. The HEAT (voltage) control adjusts the welding voltage and the WIRE SPEED control adjusts the speed of the wire drive motor.

THE MIG PROCESS AS APPLIED TO THE FM140A

The MIG process uses a bare, consumable electrode in the form of spooled wire, which is fed by a controllable speed feed unit through the cable and torch to the weld. The emerging wire and the weld are shielded by a stream of CO2, Argon, or a mixture of the two, which prevents oxidation of the molten weld puddle. The gas shield enables high quality welds to be made without the use of flux, eliminating the need for slag or flux removal after the weld is completed.

The consumable electrode wire is melted and transferred to the weld puddle by the "short arc" or "dip" transfer mode.

SHORT ARC OR DIP TRANSFER

Short arc transfer occurs at 12 to 22 arc volts (voltage while welding), depending on wire size. Welding commences as the arc is struck and a weld pool is formed. The tip of the electrode wire dips into the pool and causes a short circuit. The short circuit current flow causes a rapid temperature rise in the electrode wire and the end of the wire is melted off. An arc is immediately formed between the tip of the wire and the weld pool, maintaining the electrical circuit and producing sufficient heat to keep the weld pool fluid. The electrode continues to feed and again dips into the pool.

This sequence of events is repeated up to 200 times per second. Short arc transfer is suitable for positional welding. The heat input to the workpiece is kept to a minimum which limits distortion and makes possible the welding of thin sheet material.
DESCRIPTION

The FM140A consists of a combination MIG welding power source and wire feed unit, a MIG torch with 10 foot cable, a fifteen foot work (ground) cable with ground clamp, a twenty foot power input cable, a gas regulator/flowmeter, a torch accessory kit, and a built-in cylinder rack and industrial wheel kit.

Welder controls are simple and clearly marked. The output voltage is controlled by a twelve position tap switch, providing twelve voltage selections. Wire feed speed is controlled by the wire speed potentiometer.

A SPOT WELD control switch and adjustable timer circuit provide Consumable MIG Spot Welding capabilities of light gauge steel.

SPECIFICATIONS

PART NUMBER: FM140A

INPUT POWER REQUIREMENTS:
Voltage 115 volts AC
Phase single phase
Frequency 50/60 hertz
Current (see OUTPUT POWER)

OUTPUT POWER @ 100% Duty Cycle:
15 Amps Input Current = 100 Amps
20 Amps Input Current = 120 Amps
30 Amps Input Current = 140 Amps

DUTY CYCLE TIME PERIOD:
10 minutes

OPEN CIRCUIT VOLTAGE:
18 - 30 volts DC

ARC VOLTAGE:
14 - 26 volts DC

WELD CURRENT RANGE:
30 - 140 amps

DUTY CYCLE - SPOT WELDING:
30 X 2 second spots per 10 minute period

SPECIFICATIONS (Cont.)

SPOT WELD TIME: 0 to 3 seconds

WIRE TYPES: mild steel, stainless steel, aluminum, bronze, flux cored, flux cored - gasless

Recommended (for steel) ER70S-6

WIRE SIZES: .023" - .045" steel, 3/64" aluminum, (.023" - 3/64" alum. w/ Spool Gun) .030" - .035" bronze, .030" - .045" flux cored (gas shielded or gasless)

Recommended Size: Aluminum .035
Others .030

WIRE FEED SPEED RANGE:
10 - 500 inches per minute

SHIELDING GASES:
For Steel Argon/CO2 mix or CO2
Recommended (for steel) 75% Argon/25% CO2
For Aluminum, Bronze Argon
For Stainless Steel 98% Argon + 2% Oxygen
For Flux cored Argon/CO2 mix or CO2

DIMENSIONS:
Height 34 in. (86.4 cm.)
Width 14-1/2 in. (36.8 cm.)
Depth 23-1/2 in. (59.7 cm.)
Weight 105 lbs. (47.7 kg.)

TORCH SPECIFICATIONS

NECK ANGLE: 60 degrees

LEAD LENGTH: 10 feet

OVERALL LENGTH: 10 feet

COOLING METHOD: gas (air)

RATING - 60% DUTY CYCLE:
With Argon/CO2 gas 200 amps
With CO2 gas 225 amps
CHECK LIST

THE SNAP-ON TOOLS FM140A INCLUDES THE FOLLOWING:

1. Combination Power Source/Wire Feeder
2. Cylinder Rack/Industrial Wheel Kit
3. 15TG10 MIG Torch with adjustable nozzle
4. 20 foot Power Input Cable with Plug
5. 15 foot Work (Ground) Cable and Clamp
6. 200PK-1 Parts Kit
7. GR-FM Gas Regulator/Flowmeter
8. Nozzle, 1/2 in. orifice (installed on MIG torch)
9. Contact Tip, for .030 in. wire (installed on MIG torch)
10. ER70S-6-30-3, Sample Spool of .030" Steel Wire

ITEMS REQUIRED FOR MIG WELDING WHICH ARE NOT PROVIDED WITH THE FM140A

1. Full cover welding helmet with proper colored lens (shade 9 to 11 depending on operator’s preference).
2. Proper shielding gas and cylinder.
3. Leather welding gloves.
4. 115 volt single phase AC power.
5. Other personal protective equipment which may vary to match the welding being performed.

INSTALLATION

POSITIONING THE UNIT

Locate the unit near the welding area and position it so there is adequate clearance all around for ventilation and maintenance.

ELECTRICAL SUPPLY

Follow the Electrical Supply Requirements on page 1.

SHIELDING GAS CONNECTIONS

1. Place a cylinder of the appropriate shielding gas in the rack at the rear of the machine and secure it with the chain provided.
2. Rapidly open and close the cylinder valve. This will purge dust and foreign matter from the valve.

CAUTION

Take care to point the valve outlet away from yourself or other people, as escaping high pressure gas may be dangerous.

3. Attach the gas regulator/flowmeter supplied with this unit, to the cylinder valve using a suitable wrench.

NOTE

If this unit is to be used with 100% CO2 shielding gas, an optional gas regulator coupler is required.

FIG. 3. GAS FLOW ADJUSTMENT
SHIELDING GAS CONNECTIONS (Cont.)

4. Fit the gas hose from the welding machine to the regulator outlet fitting and tighten it with a suitable wrench. Open the cylinder valve.

5. Check that the gas regulator is properly adjusted. When welding steel, the gas flow rate is 30 CFH. When welding aluminum, the gas flow rate is 40 CFH.

NOTE
The FM140A must be turned "ON" and the MIG torch trigger depressed, before the gas flow rate can be adjusted.

TORCH CONNECTION

1. Open the access door of the machine to its fullest extent.

2. Back out the thumb screw located on the drive assembly mounting bracket inside the machine. Insert the MIG torch into the torch panel mount on the front panel and TIGHTEN THE THUMB SCREW.

4. Replace the spool clip on the hub.

5. Unlatch the pressure roll arm and swing it open.

6. Make sure the double v-groove drive roll is installed to match the wire size. To change the wire size setting, remove the drive roll, turn it over and reinstall it on the shaft.

FITTING AND THREADING THE ELECTRODE WIRE - ALWAYS USE ER70S-6 WELDING WIRE

1. Remove the wire spool clip from the spool hub.

2. Unpack the spool of welding wire from its protective packaging.

3. Place the spool of ER70S-6 welding wire onto the hub. The wire is fed off the bottom of the spool.

CAUTION

Look for and remove any wire protruding from the center of the spool. The protruding wire is electrically HOT during welding and must not touch the machine.

(continued on following page)
Fitting and threading the electrode wire (Continued)

7. Release the wire from the spool and trim off the kinked end with wire cutters. The wire must be straight when it enters the inlet guide.

8. Thread the electrode wire through the inlet guide, over the feed roll and into the torch liner. Ensure that the wire locates in the feed roll groove. Do not allow the wire on the spool to loosen.

9. Close and relatch the pressure roll arm.

10. Stretch the torch cable straight out in front of the machine making sure there are no kinks. Remove the nozzle and contact tip from the torch.

11. Turn "ON" the circuit breaker on the front of the machine. The cooling fan will start and the "ON" indicator light will illuminate. Set the HEAT control switch to "4", the function switch to "CONTINUOUS WELD" and the WIRE SPEED control to "7". Pull the trigger on the MIG torch. The wire feed system will start and wire will be fed through the cable liner and torch. If the wire does not feed, or appears to slip, tighten the pressure roll arm adjusting nut. Feed the wire until it protrudes from the front of the torch approximately six inches.

CAUTION

Keep hands and face away from the front of the torch and do not allow the wire to contact ground. The wire is electrically HOT when the torch trigger is actuated.

12. Install the contact tip over the protruding wire and tighten it firmly using a proper size wrench. Make sure the tip is the correct size for the wire being used.

13. Install the nozzle on the torch. For steel, the contact tip should be flush or stick out up to 1/16 inch beyond the end of the nozzle. For aluminum, the contact tip should be recessed 1/8 to 1/4 inch inside the nozzle. Using wire cutters, trim off the wire so the stickout is approximately 1/4 inch for steel or 1 inch for aluminum. For aluminum, the end of the wire should be bent over so it does not JAM into the work. This is called a "scratch start".

14. For steel welding only, spray anti-spatter compound inside the nozzle and on the outside of the contact tip. For aluminum or stainless steel welding, NO anti-spatter compound can be used as it will contaminate the weld.
The wire feed pressure roll is adjusted to the proper setting at the factory, prior to delivery. It may be necessary to readjust the setting as components "seat in" or when changing to a different diameter wire. To check for proper roll pressure, hold the torch in one hand and the wire between two fingers of the other hand. Pull the torch trigger. If the wire continues to feed when firm pressure is applied to the wire, the pressure roll adjusting nut should be backed off until the feed rolls start to slip. If the wire will not feed with very little pressure applied, the pressure roll adjusting nut should be tightened.

**OPERATION**

The following operating instructions and detailed setup procedures enable an operator without previous experience to produce quality fusion welds. It is recommended that an operator without prior experience with this equipment, first practice on scrap metal of the same type and thickness as the material to be welded.

**OPERATING SEQUENCE**

1. Make sure that the pieces of metal to be welded are free of grease, dirt, paint and scale. Use a wire brush to remove paint and scale. Paint must be completely removed to bare metal. Grease and oil could burn and cause a fire or safety hazard. Failure to clean the metal properly will result in erratic and porous welds.

2. Install the unit as directed in the installation instructions and make sure the work clamp is firmly attached to a cleaned area on the workpiece to be welded.

3. Open the shielding gas cylinder valve. Press the torch trigger and listen for gas flow. Adjust the gas flow rate to 30 CFH for steel and 40 CFH for aluminum.

**CAUTION**

The welding wire will feed when the trigger is actuated. Take care that the wire is not directed to hit yourself or anything that is grounded to the ground wire on the welder.
PROCESS SELECTION

The following controls are located on the front of the machine.

A. WIRE SPEED
Potentiometer controls speed of wire drive motor to give wire speed of 10 to 500 inches per minute.

B. "ON" INDICATOR LIGHT
Illuminates when the circuit breaker on the machine is "ON".

C. CIRCUIT BREAKER
Primary power switch and overload protection device.

D. (+)POSITIVE TERMINAL
Positive output terminal from the welder DC power source. The torch selector cable is plugged into this terminal for standard welding operation. The ground cable can be plugged into this terminal for straight polarity welding on very light sheet metal or for using flux cored gasless wire.

E. -(NEGATIVE) TERMINAL
Negative output terminal. The ground cable is plugged into this terminal during standard welding operation. The torch selector cable can be plugged into this terminal for straight polarity welding on very light sheet metal or for using flux cored gasless wire.

F. FUNCTION SWITCH
Controls mode of operation of welding machine. "CONT. WELD" position is for normal, continuous welding operation. "SPOT" position puts the spot timer in the circuit for automatic MIG Consumable Spot Welding. "STITCH" position is used for stitch welding on very light material. When in "STITCH" position, the length of time the welder is "ON" and feeding wire is controlled by the Spot Timer. The lower the Spot Timer setting, the faster the welder cycles on and off.

G. HEAT (VOLTAGE) CONTROL
Twelve position switch adjusts welder output voltage.

H. SPOT TIMER (STITCH TIMER)
After the torch trigger is actuated, the timer allows the wire to feed and the gas and power to flow for the time selected. The Function Switch must be set in the "SPOT" position (or the "STITCH" position for stitch welding).

I. TORCH PANEL MOUNT
Combination power output, contactor switch connection, gas supply connection, and wire feed output in a single unit.

J. TORCH SELECTOR CABLE
Plugs into (+) positive terminal for standard welding operation or (-) negative terminal for straight polarity welding on very light sheet metal or for using flux cored gasless wire.
**WELDING**

Optimum control settings will vary according to the thickness of the metal, the type of joint, operator preference, etc. Best results can be obtained through experience with the welding machine or by making trial welds. Select some sample material of the same type and thickness as the material to be welded. Set the welding controls for optimum results using the sample material and weld until experience is gained using the unit.

**CONTINUOUS WELDING ON STEEL**

1. Trim the electrode wire to leave approximately 1/4 inch stickout beyond the end of the contact tip and install the welding nozzle. The contact tip should be flush or stick out up to 1/16 inch beyond the end of the nozzle.

2. Spray the inside of the nozzle and the outside of the contact tip with anti-spatter spray.

3. Locate the torch over the joint to be welded with the contact tip approximately 3/8 inch from the work surface.

4. Use a welding helmet with a shade 9 to 11 filter lens, depending on operator preference.

5. Squeeze the torch trigger. The wire will feed and an arc will be established. As the weld is deposited, move the torch slowly along the weld seam at a constant speed, maintaining a constant arc length and a constant tip-to-work distance.

**NOTE**

When welding steel, the ideal position for holding the torch is inclined approximately 30 degrees towards the direction of travel. This allows the arc to be seen easily, resulting in greater control of the weld pool. Most right-handed welders move from left to right. This method, known as forehand welding, provides a gas shield for the cooling weld puddle and helps in obtaining an oxidation free weld deposit.
CONTINUOUS WELDING ON ALUMINUM
(Optional Nylon liner and 100% Argon shielding gas are required)

1. Trim the electrode wire, leaving approximately 1 inch stickout beyond the end of the nozzle. Bend the wire over as shown, to allow for a scratch start. The contact tip should be recessed inside the nozzle approximately 3/8 inch. This helps prevent the welding wire from burning back to the contact tip.

2. DO NOT spray any anti-spatter material on the torch or base metal and DO NOT attempt to lubricate the aluminum wire in any way. Weld contamination will occur unless the wire, base metal, torch and work area are kept clean.

3. Bring the torch nozzle to 1/2 to 5/8 inch from the workpiece. The recommended position of the torch and direction of travel for welding aluminum are shown in Figure 12.

4. Follow steps 4 and 5 as in "Continuous Welding on Steel".

MIG SPOT WELDING ON STEEL

NOTE
MIG Spot Welding is NOT recommended for aluminum.

1. Trim the electrode wire so the stickout from the contact tip will be flush with the nozzle face, and fit the spot nozzle in place.

2. Set the HEAT control to "6", the WIRE SPEED control to "8", the Function Switch to "SPOT", and the TIME control to "2", then adjust the TIME control to obtain a perfect weld.

3. Locate the torch on the area to be welded and press the nozzle firmly against the work to hold the metals in place.
MIG SPOT WELDING ON STEEL

(Continued)

4. Guard the eyes against stray arc flash. A weldor’s helmet is not necessary when spot welding. However, care must be taken to avoid looking at the arc.

5. Actuate the torch trigger to start the weld sequence. When the timer switches off the weld current, release the trigger but maintain firm contact between the torch and work. Wait one second for the weld puddle to solidify, then move to the next spot position. If the wire freezes in the puddle, a quick squeeze of the torch trigger will melt it off.

6. To ascertain a good spot weld, look at the back side of the welded material. A small melt-through of approximately 1/16 inch diameter is ideal.

STITCH WELDING ON STEEL

NOTE

Stitch Welding is used for very light material.

1. Set Function Switch to "STITCH".

2. Adjust the TIME control to set the time the welder is "on" and feeding wire. The lower the setting, the shorter the "on" time and the faster the unit cycles on and off.

3. Weld using "Continuous Welding" torch position and direction of travel.

FIGURE 13. MIG SPOT WELDING

FIGURE 14. STITCH WELDING
OPERATING HINTS

BURN BACK

In the event the welding wire burns back into the contact tip:

1. Remove the nozzle from the torch.

2. Unscrew the contact tip from the gas diffuser using a pair of pliers as the tip will be very hot.

3. Free the wire from the contact tip and clean the end of the tip so the new wire will slide smoothly through the hole. DO NOT use a drill or reamer to clean the hole as that will enlarge it and cause an erratic arc. Replace the contact tip if it is badly damaged.

4. Install the contact tip in the torch and tighten it firmly with an appropriate wrench.

5. Reinstall the torch nozzle.

6. If the wire continues to burn back, check for erratic wire feed, or speed up the wire by increasing the WIRE SPEED control setting or reducing the HEAT control setting.

SPATTER

Before beginning to weld and periodically during welding, the torch nozzle must be removed and the spatter (small globules of melted metal) cleared from the inside of the nozzle and the outside of the contact tip and the gas diffuser. Spatter buildup between the contact tip and the nozzle can cause a short circuit and consequently, failure of the torch or welding machine. The frequent use of anti-spatter spray will help prevent the adherence of spatter to the torch components.

NOTE

DO NOT use any anti-spatter spray when welding aluminum or stainless steel.

Restricted gas flow, holding the torch too far from the work piece, and the use of CO2 gas rather than 75% Argon - 25% CO2 will increase the spatter levels.

MAINTENANCE

To ensure that this equipment maintains its operating efficiency, the following maintenance schedule and procedures are recommended. These routines should be performed regularly by the operator.

REGULARLY - Usage and shop conditions determine frequency.

1. Remove and clean the torch nozzle and contact tip. The use of anti-spatter spray will reduce the adherence of spatter and makes its removal easier.

2. Blow out the torch liner prior to the installation of each new spool of wire. The contact tip and gas diffuser must be removed, but it is not necessary to remove the liner.

3. If the torch cable assembly is bent severely, a kink may develop in the steel liner. This can cause wire feeding problems so a new liner should be installed.

WEEKLY

1. Remove dirt and dust from the wire feed compartment. Use low pressure dry compressed air.

(continued on following page)
MAINTENANCE (Cont.)

2. Remove dirt and metal deposits from the grooves in the feed roll. If the grooves are badly worn, the feed roll should be replaced. If the pressure roll does not turn freely, it should be replaced.

3. Check all gas fittings for leaks. Tighten or repair as required.

EVERY SIX MONTHS

1. Disconnect the welder from its main power supply.

2. Remove the machine’s side panels.

3. Using low pressure dry compressed air, remove dust and dirt from all components.

4. Check for loose or frayed wiring. Particularly check welding current wire connections.

5. Replace the torch liner if necessary.

RECOMMENDED CUSTOMER SPARE PARTS

The Snap-On Tools FM140A is a machine of proven design and reliability. Following is a list of consumable items recommended as spare parts for this unit.

- contact tips .......... M3-T30, etc.
- gas nozzles ........... M3T-N50
- nozzle insulators .......... M3T-B
- gas diffusers .......... M3T-D
- steel liner (.020-.030) ... M103L-B
- steel liner (.035-.045) ... M104L-N

In the event of the failure of any part of this equipment, contact your Snap-On Tools representative for replacement parts and service. When ordering parts from Snap-On Tools Corporation, order numbers should be preceded by "CKS".

WARNING

- DO NOT lift the unit when a gas cylinder is installed or attached.
- DO NOT weld on any item that has a common electrical ground.
- DO NOT operate the unit with the side panels removed. Overheating will occur.
- DO NOT weld upon the case of the welding machine.
- ONLY a qualified electrician should perform work inside the welding machine.
- ALWAYS wear protective clothing, leather gloves and a full cover welding hood while welding.
- DO NOT weld in a closed in area. Proper ventilation is a necessity, or a fresh air supplied hood should be worn.
- WHEN welding near combustibles, a helper or "watcher" should stand by with a fire extinguisher or other fire protective device.
- NEVER weld on a closed vessel or one that has contained combustibles.

IF IN DOUBT – DON’T DO IT!

BE SAFE – DON’T BE SORRY!

(SYMBOL*) - USE THIS IDENTIFIER, ALONG WITH THE SCHEMATIC DIAGRAM FOUND IN THE SERVICE MANUAL, FOR TROUBLE-SHOOTING PURPOSES.
Silicon diodes have proven to be highly reliable. However, weld spatter build-up in the torch can short out and cause diode overload and consequent failure. The following information is provided as a guide should a failure be suspected.

Silicon diodes exhibit two main fault conditions:

1. "Open Circuit" - causes a reduction in welder output.
2. "Short Circuit" - causes the circuit breaker to trip.

If a fault is suspected, the diode may be tested as follows:

1. Remove the top connection of each diode to be tested.
2. Using a Volt-Ohm Meter set on RX1K, check for continuity through the diode in both directions. If there is no continuity in either direction, the diode is in "open circuit" condition and must be replaced. If there is continuity in both directions, the diode is in "short circuit" condition and must be replaced. If there is continuity in one direction only, the diode is functioning properly.

3. If all the diodes check out satisfactorily with the Volt-Ohm Meter, a load check must be made. This is easily accomplished using a twelve volt battery and a twelve volt light bulb connected as shown. Again test for electrical current flow in both directions. The bulb should light in one (1) direction only - not both.

NEVER use a "megger" or a high voltage device to test a diode.

![Diagram of Diode Load Check Connection Diagram](image)

4. When replacing diodes, it is very important that a heat conductive compound (Radio Shack #276-1372) be used where the diode makes contact with the aluminum heat sink. Do not grease the threads on the diode.
WIRE FEED CALIBRATION

Due to INPUT LINE VOLTAGE variations supplied to the welding machine. The WIRE FEED SPEED should be checked for proper operation.

TO CHECK

1. Remove any tension on the drive roll.

2. Turn the wire speed dial (on the front of the machine) to "0".

3. Activate the torch trigger.

4. The bottom drive roll should rotate very slowly (non-jerky).

5. If this proves to be true, no adjustment is required.

IF ADJUSTMENT IS REQUIRED

1. Remove the top cover assembly from the unit.

2. Locate the printed circuit boards.

3. Referring to Figure 16, locate the trim resistor, this is located in the upper right hand corner of the wire feed PC board.

4. Turn the wire speed dial (on the front of the machine) to "0".

5. Remove any tension on the drive roll.

6. Activate the torch trigger.

7. Rotate the trim resistor, back and forth, until the bottom drive roll moves.

8. Calibrate so the bottom drive roll rotates very slowly (non-jerky).

9. If calibrated correctly the wire speed dial (on the front of the machine) should affect the speed of the drive roll from "0" thru "10".

10. Adjustment is now complete!
CONNECTING TIGPAK OR SPOOL GUN

CHANGING FROM STANDARD MIG OPERATION TO TIGPAK OPERATION

1. Unplug the wire feed motor plug from the function receptacle.

2. Unplug the torch selector cable and the ground cable from the welder front panel.

3. Plug the TIGPAK torch power cable into the negative (−) weld connector and plug the ground cable into the positive (+) weld connector. This provides straight polarity current as required for TIG welding.

4. Plug the TIGPAK torch switch cord into the welder function receptacle.

5. Attach the TIGPAK torch gas hose directly to the gas regulator.

6. Follow the operating instructions in the TIGPAK manual (Form WC5228).

7. To change back to MIG operation, reverse the procedure.

CHANGING FROM STANDARD MIG OPERATION TO SPOOL GUN OPERATION

All current model MIG machines are equipped with bulkhead gas fittings for quick and easy changeover from standard MIG operation to spool gun operation.

1. Remove the thread cap from the "SPOOL GUN" fitting.

2. Unscrew the selector hose from the "MIG TORCH" fitting.

3. Move the selector hose to the "SPOOL GUN" fitting and tighten.

4. Install the thread cap (removed in step 1) on the "MIG TORCH" fitting to prevent dirt and contaminants from entering the unused gas line.

5. Unplug the wire feed motor plug from the function receptacle.

6. Plug the MHG5-A spool gun control cable plug into the welder function receptacle.

7. Remove the torch selector cable from the welder positive (+) weld connector.

8. Plug the MHG5-A gun cable fitting into the welder positive (+) weld connector.

NOTE
Make sure the gas regulator and welder gas hose are connected to a cylinder of the proper shielding gas - 100% argon for aluminum welding; 75% argon + 25% CO2 for steel welding. 98% argon + 2% O2 is recommended for stainless steel welding.

9. Follow the operating instructions in the MHG5-A manual (Form 6455).

10. To change back to standard MIG operation, reverse the procedure.
M.I.G. TORCH LINER INSTALLATION (steel only)

The MIG torch liner provided with the FM140A is designed for wire diameters from .020 thru .030. If larger wire diameters are to be fed and or there is a problem (i.e. clog, kink, etc.), a liner change is required.

Following is a step by step guide to aid in liner removal and installation.

NOTE
When removing the welding wire from the MIG torch, care should be taken to avoid the wire from uncoiling from the wire spool.

REMOVING OLD LINER

1. Remove torch assembly from the welding machine.

2. Place torch assembly on a flat surface, making sure torch is laying straight as possible.

3. Remove nozzle, bushing insulator, contact tip and gas diffuser from the front end of the torch assembly.

4. Loosen set screw located on the connector end of the torch assembly (see FIG. 19).

5. Grip the liner and gas seal firmly, then pull. The liner should easily slide from torch assembly.

INSTALLING NEW LINER

1. Remove the new liner from the package.

2. Uncoil liner and lay the liner parallel next to the MIG torch assembly.

3. Adjust the liner stickout length to 3/4" as shown in FIG. 18.

4. Install the new liner into the MIG torch assembly, until gas seal seats flush with the connector plug.

5. Tighten set screw. (Do not overtighten), refer to FIG. 19.

6. Following the diagram in FIG. 20, measure out 1 1/4"+ from the neck assembly and cut off the protruding liner.

7. Debur the cutoff end of the liner to insure unobstructed wire feed.

8. Install the gas diffuser and contact tip of proper wire size, tighten with a wrench.

9. Install the bushing insulator onto the gas diffuser. Spray the "O" rings with anti-spatter compound for lubrication.

10. Install the TWIST-ON adjustable nozzle and twist the nozzle during the installation. Turn to Page 7 for correct nozzle adjustment.

  - (2 REQUIRED)
- M3-310A: BOOT / CABLE SUPPORT
- SN-807G: CABLE COVER

#### NOTES:
- * BECAUSE SPECIAL TOOLS AND PROCEDURES ARE REQUIRED TO PROPERLY INSTALL THE CABLE ON THE TORCH NECK AND THE CONNECTOR STEM, ITEMS WITH THE ASTERICK ARE AVAILABLE FACTORY INSTALLED ONLY.

### FIGURE 22. REPAIR (REPLACEMENT) PARTS

15 SERIES TORCHES CAN BE REBUILT BY THE FACTORY FOR A NOMINAL LABOR + PARTS CHARGE.
NOW! TIG WELD WITH YOUR
SNAP-ON TOOLS MIG WELDING MACHINE
(M140i, FM140A, YA204C, YA212A or YA212A INDUSTRIAL)

The TIG Welding Process is used to produce the highest quality, porosity-free welds. The TIG PAK adds TIG Welding capabilities to your Snap-On Tools MIG Welder.

The TIG PAK is designed for Tungsten-Inert Gas (TIG) welding with Direct Current, Straight Polarity (DCSP) on steel, stainless steel, chrome-moly, copper or cast iron (12 Gauge minimum plate thickness).

THE TIG PAK WILL NOT WELD ALUMINUM.

The TIG PAK consists of a 200 amp, gas cooled TIG torch with built-in gas control valve and remote on-off switch, 12-1/2 or 25 foot cable assembly and accessories required for putting the unit into service.

**CONTENTS OF TIG PAK**

1 each TIG Torch with built-in valve
1 each Locking Electric Switch with 14 foot cord (installed on torch)
1 each 12-1/2 foot Power Cable with Connector (installed on torch)
1 each 15 foot Gas Hose with fitting (installed on torch)
3 each 3C332 Collet - for 3/32" tungsten
3 each 3C418 Collet - for 1/8" tungsten
2 each 3CB332 Collet Body - for 3/32" tungsten
2 each 3CB418 Collet Body - for 1/8" tungsten
2 each 3C6 Gas Cup - 3/8" orifice
6 each 3C7 Gas Cup - 7/16" orifice
2 each 3C8 Gas Cup - 1/2" orifice
1 each 300L Long Backcap
3 each 3/32" X 3" Tungsten Electrode
3 each 1/8" X 3" Tungsten Electrode

**ONE POUND SPOOL GUN**

FOR ALUMINUM MIG WELDING
WITH SNAP-ON TOOLS
MIG COMBINATION UNITS
(M140i, FM140A, YA204C, YA212A, YA212A INDUSTRIAL)

The MHG5-A (Motorized Hand Gun System) is a compact, light-in-weight, easy to operate MIG welding system designed for aluminum welding. It will feed .030", .035" or 3/64" diameter wire from 4 inch spools. The standard cable is 25 feet in length. 35 foot and 50 foot cables are optional. The wire speed control knob is in the gun handle.

With the following options, the MHG5-A can be used to weld steel or stainless steel (.030" - .035" diameter wire sizes).

**SN-2160K**

Knurled Drive Roll - for .030" - .035" steel wire

**M5-T30**

Contact Tip - for .030" steel wire

or **M5-T35**

Contact Tip - for .035" steel wire
